FIBRO STANDARD PARTS YOUR PRODUCTION PARTNER

As a leading provider for Standard Parts for the tool & die industry, FIBRO offers a unique range of high precision products. With over a million different items, of which 40,000 are constantly in stock and available at short notice, FIBRO Standard Parts is a guaranteed one-stop shop for tool manufacturers around the world.

FIBRO exceeds our customers high quality expectations by following the most robust manufacturing processes ensuring that the tight tolerance and accuracy requirements of our products are delivered.

The wide range of services we offer gives you multiple ways to access support from us: for example in direct contact via support with the appropriate product selection and design, by delivering all the necessary CAD data and seamless workflows in dispatch.

Profit from the combination of companies operating on the international stage, and specialist firms rooted in their specific regions.

around 600
employees worldwide

production plants in
Germany, Italy, India
and China

45 agencies around
the world

a quality management system
in line with DIN EN ISO 9001

FIBRO branch offices in
France, Poland, the USA,
India, Singapore and Korea

an environmental
management system in line
with DIN EN ISO 14001

INNOVATION FROM TRADITION

The Standard Parts Division operates from the facilities in Hassmersheim, India, and China. Here, a large range of standard parts are manufactured, stored, and shipped to customers worldwide.

The product range is tailored to customers in the tool, mold, machine, and system engineering industries.

They include steel die sets, guide elements, oilless guide elements and precision components such as punches and matrixes, special steel compression springs, gas springs, forming materials, metal bonding agents, moulding resins, peripheral equipment for pressing and tool making, tool slides with cam or roller slides and hydraulic cam systems.

Experience and expertise
you can rely on
FIBRO Quality Assurance

Experience and expertise you can rely on FIBRO Quality Assurance

FIBRO is renowned for its quality world-wide. This high quality is achieved through our dedication and commitment to Quality Assurance.

FIBRO testing starts on the raw material and continues right through production to the completed product. The test facilities themselves are also subject to stringent continuous testing. Only by setting itself such stringent standards can a company support its customers long term in safety, cost-effectiveness and quality.

Tests during production

Precision shape and contour testing equipment is used directly in production. This ensures early confirmation of the quality of the product.

The shape testing equipment tests for qualities such as roundness, concentricity, straightness and rectangularity.

FIBRO state of the art technology provides 3D visualisation of concentricity, coaxiality and cylindricity.

Materials testing - raw materials to specification

The FIBRO laboratories carry out microscopic investigation of the raw materials, including enlargement to 2,500 times natural size.

Spectral analysis determines whether the material is correct in terms of chemical composition.

Hardening – hardness testing

All the process parameters in the hardening process in our own hardening shop are recorded and documented.

Hardness testing is used to monitor the results of the hardening process on every batch.

Final tests

For precision at micro level if certain basic requirements have to be met. It goes without saying that the temperature of the measuring room at FIBRO is kept at 20°C. Here the fine precision FIBRO products are measured after production before being released to the customer.

FIBRO – CAM UNIT CONFIGURATOR

FIBRO offers a comprehensive cam unit portfolio for various requirements. The FIBRO - Cam unit configurator on our Internet site will assist you with the selection of the matching cam unit for your application.

The configuration of your cam unit is done in four steps:

1. Angle
2. Cam unit type
3. Width of working surface (min.)
4. Height of working surface (min.)

After this, an initial hitlist with max. 10 matches will be displayed. Further restrictions can be used to narrow down the selection list:

5. Cam unit working stroke (min.)
6. Cam unit working force (min.)
7. Retraction force (min.)
8. Life time

Link to the cam unit configurator:

EMERGENCY SITUATION / CONTACTS

DESIGN, CONSTRUCTION

ENGINEERING

The FIBRO cam unit program offers matching system solutions for the widest range of applications. From the use in progressive punching tools with the smallest dimensions up to the demanding use in large tools. From the use in tools with small piece numbers up to premium applications in the manufacture of bodywork parts with the highest requirements in terms of precision, lifetime and process force transmission, our cam unit program offers the matching solution to your application. The fault-free operation is guaranteed by FIBRO over the guaranteed, nominal lifetime. The design of the cam units, in the course of the tool construction, is indispensable in this regard. Operating conditions of the tool, as well as the expected environmental influences, must be taken into account to the best extent possible. Using a precise and conscientious design, it is possible to achieve a lifetime which extends far beyond the guaranteed stroke rate.

The desired lifetime can only be achieved by using the cam units as intended. An overloading of the cam units will reduce the number of strokes of the cam unit and can, in the extreme case, lead to the immediate failure of the cam unit during the initial strokes.

The operational reliability of FIBRO cam units is demonstrated by the guaranteed number of strokes. The size of the working force, the position of the center of the force on the working surface and the sequence of the introduction of the force, all have an effect on the system. All performance specifications were calculated using factors known to us at the time of printing. Changed operation conditions can influence the lifetime of the cam unit and must be taken into account separately in consultation with the operator.

FIBRO supports you competently throughout the entire process chain: Starting with the selection of a suitable cam unit for your application, to the correct design, up to the delivery of the cam unit to the assembly, FIBRO is by your side when you have questions. After the completion of the engineering and assembly phase, FIBRO's after-sales support also provides you with professional support for your needs. Take advantage of our experience as a standard system supplier for toolmaking and customise your tools with our products to your specific applications in the most optimal way.

DEFINITION OF TERMS

Aerial cam unit (I)

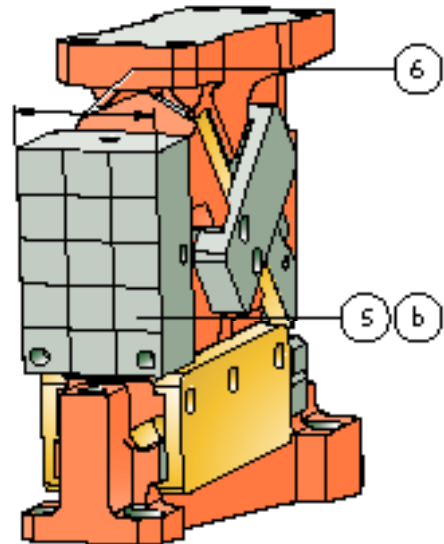

Die mounted cam unit (II)

Installed state,
Depicted 100 mm in front of bottom dead center

Cam unit mounted in the upper die:
Lifts with upper die during the course of the press cycle.

Cam unit mounted in the lower die:
Remains seating on the lower die during the course of the press cycle.

Cam diagram (A)

ENGINEERING

DEFINITION OF TERMS

(I)	Aerial cam unit	Assembly cam base / cam slider is mounted in the upper die, the driver in the lower die. Aerial cams are preferably utilised to increase press cycle times.
(II)	Die mounted cam unit	Assembly cam base / cam slider is mounted in the lower die, the driver in the upper die. Die mounted cam units improve the tool dynamics, since the moved mass is reduced in the upper die.
(1)	Cam base	Assembly for receiving the traveling slide body.
(2)	Cam slider	Assembly with the working surface for accommodating the tool-specific components. The cam slider assembly is mounted in the cam base so that it travels linearly.
(3)	Cam driver	Component or assembly which drives the slider body in the course of the press movement.
(4)	Positive return	Constructional device on the cam unit, which retracts the slide body mechanically during the upwards stroke of the press into the initial position.
no figure	Pre-acceleration	Constructional device on the cam unit, which influences the acceleration and braking behaviour of the cam slider in the press stroke. Version as plate or roll pre-acceleration possible.
(5)	Working surface	Surface on the cam slider for accommodating the tool-specific components.
(6)	Working width	Width of working surface
no figure	Maximum permissible working force	Maximum permissible force acting perpendicular to the working surface, with which the cam unit achieves the nominally guaranteed lifetime.
(b)	Force diagram	Specifies the maximum permissible working force when the centre of the force is located in different sectors on the working surface.
no figure	Stripper force	The force required by the parameters of the working process, which is necessary to return the tools to the initial position (tool / process-condition) after reaching the presses bottom dead center.
no figure	Retraction force	Constructionally related force of the cam unit, which returns it to the starting position after reaching the presses bottom dead center.
no figure	Return force	Force which is necessary in order to return the cam slider in the cam base back to the initial position without the action of a process-related stripper force.
no figure	Spring force	Constructionally related nominal force of the spring component used in the cam unit
(A)	Cam diagram	Represents the angle and distance ratios of the cam unit.
(ε)	Cam angle	Operating direction of the cam unit - angle of the cam unit working direction measured to the horizontal.
(α)	Driver angle	Angle of the driver gliding surface measured to the horizontal.
(β)	Base angle	Angle of the cam base gliding surface measured to the horizontal.
(γ)	Included angle	Angle of the sliding surfaces on the cam slider between driver and base.
(δ)	Pre-acceleration angle	Angle of the pre-acceleration gliding surface measured to the horizontal.
(S_w)	Cam stroke	Usable stroke in the working direction of the cam unit (representation aerial cam unit with and without pre-acceleration).
(S_s)	Spring stroke	Stroke of the spring in the cam unit.
(S_p)	Press stroke	Distance in the press direction required to close the cam unit completely.
(S_A)	Pre-acceleration stroke	Stroke which the cam unit travels when a pre-acceleration mechanism is used in the direction of the latter.

ENGINEERING

DESIGN TOOL CONNECTION

The size of the maximum force transferable by the cam unit is significantly influenced by the type of installation chosen. A technically correct selection of the installation type must be considered analogue to the cam unit design.

The working force can be transmitted via the shoulder of the cam base on FIBRO cam units, alternatively via concealed fitting wedges on the cam base support. The shouldered installation allows maximum load values to be transferred, while a compact mounting space can be realized by installing via the concealed seating wedges. The reduced load values must be observed when installing via the feather keys.

The manufacture of the cam unit interface in the tool can be optimised by means of simple constructional solutions and cost-effectively, without loss of performance.

Force transmission via shoulder

The maximum power values of the cam unit are achieved by the shouldering of the cam base in the nominal shoulder height (see catalogue specifications). It is not necessary to shoulder the die over the entire height of the cam base.

In the following, three possible versions of the shouldering of the cam base in the die are shown, the designs 2 + 3 thereof are preferred since production is optimised.

1. Shouldering over entire cam base height

Figure 1: Cam base completely shouldered

ENGINEERING

DESIGN TOOL CONNECTION

- Shouldering via cast shoulder in the upper area of the cam base, lower area exposed

Figure 2: Cam base shouldered at top

- Shouldering via inserted feather key between cam base and die casting in the upper area of the cam base, lower area exposed

Figure 3: Cam base shouldered at top with key

ENGINEERING

DESIGN TOOL CONNECTION

Force transmission via feather key

In the case of lower requirements on the transmission of force, the cam unit can be installed in the tool by means of bracing via the key so that it is optimised to the installation space. For the mechanical machining of the feather key groove, in this case a distance from the groove geometry to the possible interference geometries in the die cast of at least 140 mm must be observed in order to avoid a collision of the milling spindle.

Figure 4: Milling spindle clearance

FIBRO cam units must be fitted with head cap screws having strength class 8.8 or higher.

ENGINEERING

CAM UNIT DESIGN

The operating reliability is demonstrated independently of the operating mode as follows:

1. Evaluation of the calculated operating force
2. Evaluation of the arithmetical centre of force and formation of the substitute force
3. Comparison of the substitute force with permissible force

The operating force is generated by the tools mounted on the cam during the engagement in the sheet metal. When determining the operating forces, the following operating modes are distinguished:

- a) **Cutting**
- b) **Punching**
- c) **Forming**
- d) **Operations with additional stripper**

a) Cutting

During cutting, the operating force is created by overcoming the shear strength of the machined sheet metal part.

The force is calculated using the formula:

$$F_s = l \times s \times \tau_T \quad [1]$$

Cutting length [l] and sheet thickness [s] are taken from the method plan, the shear strength [τ] from material tables. If there are no values for the shear strength, this can be approximately determined from the tensile strength. For ductile materials, this amounts to between 60 and 90% of the tensile strength.

In general, the maximum value of the possible characteristic range of the sheet material must be used as a basis for the calculation because the steel grades are produced and delivered within the specified range. Thus, the characteristic values of the processed sheets can assume the highest permissible characteristic values and thus also the highest possible loads on the tool components can be applied.

For evaluating the cam unit stability, the centre of force applied by the cutting is determined and compared with the force diagram of the desired cam unit. The centre of force of the cutting is determined by means of the centre of mass of the cutting line. For this purpose, complex, free-shaped sections can be dissected into a sufficiently precisely segmented substitute contour with known segment focal points (see Fig. 5)

ENGINEERING

CAM UNIT DESIGN

Figure 5: Cutting contour original and approximated

The total centre of force is determined from the individual segments of the line:

x value:

$$x_c = (x_1 \times l_1 + x_2 \times l_2 + x_n \times l_n) / (l_1 + l_2 + l_3) \quad [2]$$

y value:

$$y_c = (y_1 \times l_1 + y_2 \times l_2 + y_n \times l_n) / (l_1 + l_2 + l_3) \quad [3]$$

The following boundary conditions apply to the calculation model:

In this determination of the centre of force, a uniform trim steel engagement is assumed. A non-uniform trim steel engagement determines both the change in the cutting force F_T as well as the centre of the force C_F over the cutting line t_T .

Force-reducing measures such as, for example, the targeted manipulation of the cutting line are not taken into account in this consideration. The modification of the strength values by a cold work hardening of the material in preliminary forming operations is likewise not taken into account in this consideration. It applies in particular to modern, high-strength materials for vehicle structural components (e.g. in dual phase steels) and depends on the material as well as on the degree of metal forming. Cold work hardening effects must be taken into account in the individual case in the design of the cam unit. If a stripper is used on the cam unit, the loading by the stripper must be taken into account accordingly (see section d).

ENGINEERING

CAM UNIT DESIGN

b) Punching

Punching is a special form of cutting. The determination of the operating force thus follows a similar scheme, although some important particulars have to be considered.

The determination of the force is performed analogous to the calculation of the force during cutting. In the case of punching operations, several punches are often arranged on a cam unit. In this case, the force introduced by each punch must be determined as well as the sum of all individual forces.

$$F_{Pn} = I_n \times s \times T_T \quad [4]$$

$$F_{Ptotal} = F_{P1} + F_{P2} + F_{Pn} \quad [5]$$

As a second step, the determination of the centre of the force is carried out analogously to the design during cutting. In contrast to simple cutting, the position of each individual punch and the position of centre of mass of the sum of the individual cells must be examined during punching and compared with the force diagram. This is necessary, since during punching onto a mould surface, each punch engages with a very high probability at a different point in time, and the load in the cam unit is also introduced in a steplike manner.

The centres of the force are calculated as follows:

Figure 6: Hole sample

ENGINEERING

CAM UNIT DESIGN

P ₁ (round hole)	>	centre of force in the centre
P ₂ (slot)	>	centre of force in the centre
P ₃ (square hole)	>	centre of force in the centre
P ₄ (shaped hole)	>	determination of the centre by calculating the line centre

In the determination of the total centre of the force of a punching field, the individual cutting lengths of each punch are replaced by the punching forces. The total centre point of the punch field can thus be determined from the individual centre positions:

x value:

$$x_C = (x_1 \times F_{P1} + x_2 \times F_{P2} + x_n \times F_{Pn}) / (F_{P1} + F_{P2} + F_{Pn}) \quad [6]$$

y value:

$$y_C = (y_1 \times F_{P1} + y_2 \times F_{P2} + y_n \times F_{Pn}) / (F_{P1} + F_{P2} + F_{Pn}) \quad [7]$$

Boundary conditions of this calculation model:

In the consideration, a uniform punch engagement of each individual punch is assumed, which is the exception due to the component shape. Tilt and bending of the mould surfaces cause a delayed plunging of the punches. The cutting force reduction by these geometric effects is not taken into account in this calculation model.

The load is changed by the use of a stripper. This must be taken into account in the cam design (see section d)

c) Forming

The term "forming" includes all operations that cause a ductile, permanent form change of the component. The following work operations belong to the forming operating mode:

- Chamfering
- Adjustment
- Postforming
- Drawing

The force required for moulding depends on the shape and the material characteristics. Forming operations on vehicle components are usually complex due to the free form of the components and produce a multi-axial state of stress. The determination of the forces required for this purpose is only possible with difficulty or only with a disproportionate effort. The moulding forces occurring can usually be determined by a drawing simulation. Hard die spotting ("drive to final pressure" / "run against block") with the cam unit is to be avoided if possible. By insufficient coordination of this operation, forces can be introduced into the cam, which exceed the permissible maximum of the allowed operating load by a multiple. Thereby, an immediate failure of the cam unit is possible.

ENGINEERING

CAM UNIT DESIGN

d) Operations with additional stripper

An additional force is introduced into the cam by the use of a stripper resp. cam pad. It is to be taken into account accordingly.

Strippers are used as a stripper plate or as an elastomer / pop-on stripper. The calculation of the centre of force of both variants differs.

Figure 7: Cam unit with elastomer stripper

Figure 8: Cam unit with stripper plate

ENGINEERING

CAM UNIT DESIGN

d.1) Elastomer-/Pop-on stripper

Elastomer / Pop-on strippers are extremely compact stripper units, which are directly attached to the supporting plate of a punch. By this arrangement, the centre of mass of an elastomer / pop-on stripper element is centred on the centre axis of the punch.

The total operating force corresponds to the sum of the cutting and stripping force. The centre of mass is then calculated analogous to punching.

d.2) Stripper plate

The centre of the force produced by the stripper plates, in contrast to elastomer / pop-on strippers, is not coincident with the centre of mass force of the working operation. If working with a stripping plate, both the total centre of force of the working operation + stripper plate as well as the centre of force of the stripper plate alone must be compared with the permissible operating force of the cam. This is due to the fact that the load of the stripper plate continues to be present after the fall of the operating force, for example, after punching through the sheet, until the stripper springs are released while opening the die.

Figure 9: Hole pattern with gas spring

ENGINEERING

CAM UNIT DESIGN

Centre of force of the elastomer / pop-on stripper:

x value:

$$x_{CA} = (x_1 \times F_{S1} + x_2 \times F_{S2} + x_n \times F_{Sn}) / (F_{S1} + F_{S2} + F_{Sn}) \quad [8]$$

y value:

$$y_{CA} = (y_1 \times F_{S1} + y_2 \times F_{S2} + y_n \times F_{Sn}) / (F_{S1} + F_{S2} + F_{Sn}) \quad [9]$$

Total centre of operating force and stripper force:

x value:

$$x_{Ctotal} = (x_{CA} \times \text{Sum } F_S + x_{CB} \times F_B) / (\text{Sum } F_S + F_B) \quad [10]$$

y value:

$$y_{Ctotal} = (y_{CA} \times \text{Sum } F_S + y_{CB} \times F_B) / (\text{Sum } F_S + F_B) \quad [11]$$

ENGINEERING

PROOF OF LIFETIME

The lifetime test is carried out by comparing the existing operating force with the maximum operating force permitted for the guaranteed lifetime. This results in the statement whether or not the cam unit with the introduced force reaches the guaranteed lifetime.

Cutting

The calculated operating force in the determined centre of the force is compared with the permissible operating force from the force diagram of the desired cam unit. The cam unit maintains the guaranteed lifetime if

$$F_B \leq F_{zul} \quad [12]$$

Punching

When punching, each individual punch P_n must be compared with its centre of mass C_n , as well as the sum of all punches with the total centre of the force point, with the force diagram of the desired cam unit. The cam unit maintains the guaranteed lifetime if

$$F_{Bn} \leq F_{zul} \quad [13]$$

and

$$F_{Btotal} \leq F_{zul} \quad [14]$$

Forming

The operating force determined from the drawing simulation and applied at the centre of the force point is compared with the permissible operating force from the corresponding force diagram. The cam unit maintains the guaranteed lifetime if

$$F_B \leq F_{zul} \quad [15]$$

Stripper with cam stripper plate

When a cam stripper plate is used, the sum of the operating force + stripping force, with its associated centre of the force point, as well as the stripping load alone, must be compared with its centre of the force point with the force diagram. The cam unit maintains the guaranteed lifetime if

$$F_A + F_B \leq F_{zul} \quad [16]$$

and

$$F_A \leq F_{zul} \quad [17]$$

General instructions

- The force specifications of the individual force diagram sectors must never be added.
- The substitute force with the corresponding centre of the force point must always be formed in accordance with the preceding descriptions and these must be compared with the force diagram.
- The specifications in the force diagram correspond to the punctually introduced substitute loads and are not surface pressure specifications!

General notes on permissible operating force

As a matter of principle, the transverse loads acting on the cam unit are to be absorbed by design measures in the tool. Uncompensated transverse loads can have a massively negative effect on the cam unit lifetime.

ENGINEERING

RETRACTION AND RETURN FORCE

Determined by the tension conditions and resulting elastic deformations in the machined sheet metal, cutting and forming components stick after the machining process when the bottom dead centre is reached. Accordingly, a stripping force is required to pull the tools out of the sheet into the initial position. For the design of tools, an approximate calculation of the stripping forces, based on experience values, is sufficiently accurate. The stripping force is calculated as a percentage of the working force.

For cutting operations, this amounts to:

$$F_A = 0.07 \times F_T \quad \text{[valid for open cutting contours]} \quad [18]$$

$$F_A = 0.10 \times F_T \quad \text{[valid for closed cutting contours]} \quad [19]$$

In the case of forming operations, the stripping forces vary to a greater degree. When determining the stripping forces during forming operations, the instructions of the tool manufacturers or operators must be observed.

Cam units have a system-related retraction capability. This can be used to overcome the necessary stripping force. If the retraction capacity of the cam unit is higher than the necessary stripping force, no tool-specific actions need to be taken to return the die components to the initial position. In this case, the cam unit can work directly through the main pad of the die.

$$F_R > F_A \quad [20]$$

If the retraction capacity of the cam unit is less than the tool- or process-specific stripping force, then constructional measures need to be provided, such as the use of a cam stripper.

$$F_R < F_A \quad [21]$$

The retraction force specifications of all FIBRO cam units refer to the working direction of the cam unit, thus, a conversion is not necessary.

If an aerial cam unit remains in its bottom dead centre after the working operation, considerable damage to the cam unit and die is to be expected due to collision of die components while opening it.

In contrast, if a die mounted cam remains in its bottom dead centre after the working operation, then no profound damage is to be expected in the event that the cam does not operate through the main pad. As a rule, the die mechanism in this case is not able to remove the blank out of the die, which stops the movement of the machine by means of the mechanisation sensor system.

If the die components of a die mounted cam also operate through the main pad, similar damage to the cam and die as in the case of an aerial cam unit is to be expected.

Please note that for this reason, the mechanical retraction clamps must not be removed without consulting with FIBRO.

ENGINEERING

CALCULATION EXAMPLES

The design for die construction is illustrated by the following three examples.

1. Cutting

a) by main pad

Process parameters:

Cam unit angle 40°

greatest width of the cutting line on cam 278 mm

Cutting contour see figure

Length $l = 305.9$ mm

Sheet metal thickness $s = 0.7$ mm

Material DX51D+Z; max. tensile strength $R_m = 270 \dots 500$ N/mm²

open cutting line: Stripping force 7% of cutting force

Figure 10: Cutting contour

Determination cutting force F_T (= Operating load F_B)

$$F_T = l \times s \times \delta_T = l \times s \times R_m \times 0.8$$

$$F_T = 305,9 \text{ mm} \times 0.7 \text{ mm} \times 500 \text{ N/mm}^2 \times 0.8$$

$$F_T = 85.7 \text{ kN}$$

Determination stripping force F_A

$$F_A = F_T \times 0.07$$

$$F_A = 85.7 \text{ kN} \times 0.07$$

$$F_A = 6 \text{ kN}$$

ENGINEERING

CALCULATION EXAMPLES

Determination of centre of the force C_F

The cutting contour is segmented into the replacement cutting contour, compare figure. The mass centres of the individual segments of the replacement cutting contour are known.

For the calculation of the total centre of the force, the zero point of the coordinate system is assumed to be $x + 12.5 / y - 23.5$ measured from the left outermost corner of the cutting contour. The lengths, as well as single centre of mass values of the individual contours are as follows (graphically determined values):

No.	Type	Length contour element (mm)	x_C (mm)	y_C (mm)
1	Line	146.7	57.4	45.7
2	Arc	62.8	155.6	61.1
3	Line	48	207.1	69.1
4	Line	21.8	233.7	57
5	Line	29.4	250.9	44.7

The position of the total centre of the force is calculated from the values of the individual segments:

$$x_C = (x_1 \times l_1 + x_2 \times l_2 + x_3 \times l_3 + x_4 \times l_4 + x_5 \times l_5) / (l_1 + l_2 + l_3 + l_4 + l_5)$$

$$x_C = (57.4 \text{ mm} \times 146.7 \text{ mm} + 155.6 \text{ mm} \times 62.8 \text{ mm} + 207.1 \text{ mm} \times 48 \text{ mm} + 233.7 \text{ mm} \times 21.8 \text{ mm} + 250.9 \text{ mm} \times 29.4 \text{ mm}) / (146.7 \text{ mm} + 62.8 \text{ mm} + 48 \text{ mm} + 21.8 \text{ mm} + 29.4 \text{ mm})$$

$$x_C = 131.5 \text{ mm}$$

$$y_C = (y_1 \times l_1 + y_2 \times l_2 + y_3 \times l_3 + y_4 \times l_4 + y_5 \times l_5) / (l_1 + l_2 + l_3 + l_4 + l_5)$$

$$y_C = (45.7 \text{ mm} \times 146.7 \text{ mm} + 61.1 \text{ mm} \times 62.8 \text{ mm} + 69.1 \text{ mm} \times 48 \text{ mm} + 57 \text{ mm} \times 21.8 \text{ mm} + 44.7 \text{ mm} \times 29.4 \text{ mm}) / (146.7 \text{ mm} + 62.8 \text{ mm} + 48 \text{ mm} + 21.8 \text{ mm} + 29.4 \text{ mm})$$

$$y_C = 53.2 \text{ mm}$$

Figure 11: Cutting contour approximated

ENGINEERING CALCULATION EXAMPLES

The determined force values are compared with the performance data of the selected cam unit. For this work operation, an aerial cam unit of the 2016.24. series with a working width of 260 mm is to be used. The cam unit has the following performance data:

- max. working force (shouldered installation): 737 kN
- max. working force (installation with feather key): 359 kN
- Retraction force: 36.4 kN

The total centre of force of the cam cut is on the quadrant of the force diagram with 737 kN permissible load (shouldered) or 320 kN permissible load (installed with feather key). The cam unit can therefore be installed with the given cutting contour and the applied process parameters both with the force relief via a shoulder on the rear side of the cam base as well as via the feather key inserted into the cam base supporting surface in the die:

$$F_T < F_{\text{permissible feather key}} < F_{\text{permissible shoulder}}$$

$$85.7 \text{ kN} < 320 \text{ kN} < 737 \text{ kN}$$

Figure 12: Cutting contour with force diagram

No further actions have to be taken to move the cam unit back in the initial position when the press is opened – the retraction force of the cam unit is higher than the process-induced stripping force:

$$F_R > F_A$$

$$33.6 \text{ kN} > 6 \text{ kN}$$

ENGINEERING

CALCULATION EXAMPLES

2. Punching

a) by main pad

Process parameters: Cam unit angle 15°
 largest distance between punch centres is 72.6 mm
 Punch contours, see figure
 Contour lengths and individual centres of the force, see table
 Sheet metal thickness $s = 1.5 \text{ mm}$
 Material D750MS /+Z; max. tensile strength $R_m = 1,000 \dots 1,200 \text{ N/mm}^2$
 closed cutting line: Stripping force 10% of cutting force

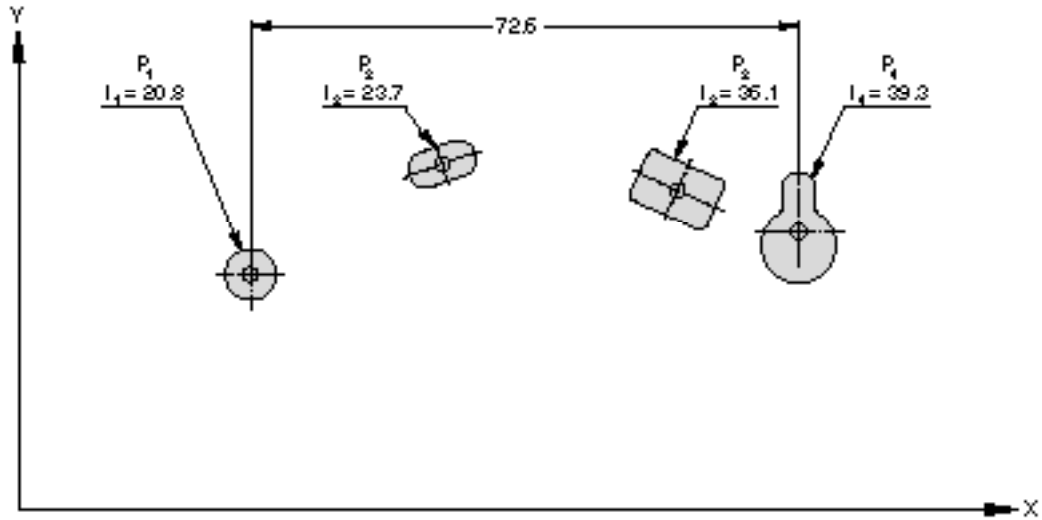

Figure 13: Hole pattern with size estimation

Determination cutting force during punching F_{Pn} (= Operating force F_B)

$$F_p = l \times s \times \delta T = l \times s \times R_m \times 0.8$$

Punch P_1 :

$$F_{P1} = 20.9 \text{ mm} \times 1.5 \text{ mm} \times 1,200 \text{ N/mm}^2 \times 0.8$$

$$F_{P1} = 30.1 \text{ kN}$$

Punch P_2 :

$$F_{P2} = 23.8 \text{ mm} \times 1.5 \text{ mm} \times 1,200 \text{ N/mm}^2 \times 0.8$$

$$F_{P2} = 34.3 \text{ kN}$$

Punch P_3 :

$$F_{P3} = 36.1 \text{ mm} \times 1.5 \text{ mm} \times 1,200 \text{ N/mm}^2 \times 0.8$$

$$F_{P3} = 52 \text{ kN}$$

Punch P_4 :

$$F_{P4} = 39.3 \text{ mm} \times 1.5 \text{ mm} \times 1,200 \text{ N/mm}^2 \times 0.8$$

$$F_{P4} = 56.6 \text{ kN}$$

ENGINEERING

CALCULATION EXAMPLES

Total cutting force F_{Ptotal} during punching:

$$F_{Ptotal} = F_{P1} + F_{P2} + F_{P3} + F_{P4}$$

$$F_{Ptotal} = 30.1 \text{ kN} + 34.3 \text{ kN} + 52 \text{ kN} + 56.6 \text{ kN}$$

$$F_{Ptotal} = 173 \text{ kN}$$

Determination stripping force F_A

$$F_A = F_{Ptotal} \times 0.1$$

$$F_A = 173 \text{ N} \times 0.1$$

$$F_A = 17.3 \text{ kN}$$

Determination of the total centre of the force

The centres of the force of the individual punches are known. For the calculation of the total centre of the force, the zero point of the coordinate system is assumed to be $x + -26.6 / y - 31.2$ measured from the centrepoint of the punch P_1 . The positions of the individual centre of the force values result from the method plan as follows (graphically determined values):

No.	Type	Length (mm)	x_C (mm)	y_C (mm)
P_1	Round hole	20.8	26.6	31.2
P_2	Slot	23.7	51.8	45.9
P_3	Square hole	36.1	83.2	42.5
P_4	Keyhole	39.3	99.3	36.1

The position of the total centre of the force is calculated from the values of the individual punches:

$$x_C = (x_1 \times F_{P1} + x_2 \times F_{P2} + x_3 \times F_{P3} + x_4 \times F_{P4}) / (F_{P1} + F_{P2} + F_{P3} + F_{P4})$$

$$x_C = (26.6 \text{ mm} \times 30.1 \text{ kN} + 51.8 \text{ mm} \times 34.3 \text{ kN} + 83.2 \text{ mm} \times 52 \text{ kN} + 99.3 \text{ mm} \times 56.6 \text{ kN}) / (30.1 \text{ kN} + 34.3 \text{ kN} + 52 \text{ kN} + 56.6 \text{ kN})$$

$$x_C = 72.4 \text{ mm}$$

$$y_C = (y_1 \times F_{P1} + y_2 \times F_{P2} + y_3 \times F_{P3} + y_4 \times F_{P4}) / (F_{P1} + F_{P2} + F_{P3} + F_{P4})$$

$$y_C = (31.2 \text{ mm} \times 30.1 \text{ kN} + 45.9 \text{ mm} \times 34.3 \text{ kN} + 42.5 \text{ mm} \times 52 \text{ kN} + 36.1 \text{ mm} \times 56.6 \text{ kN}) / (30.1 \text{ kN} + 34.3 \text{ kN} + 52 \text{ kN} + 56.6 \text{ kN})$$

$$y_C = 39.1 \text{ mm}$$

ENGINEERING CALCULATION EXAMPLES

Figure 14: Hole pattern with individual centre of mass

The determined force values are compared with the performance data of the selected cam unit. For this work operation, preferably, a compact aerial cam unit of the 2016.24. series is to be used.

Due to the maximum distance of about 72.6 mm of the centre of mass of the holes, an attempt is made to use a cam unit with a width of 110 mm and a multi-punch retainer plate.

The selected cam unit has the following performance data:
 max. working force (shouldered installation): 372 kN
 max. working force (installation with feather key): 93 kN
 Retraction force: 5.8 kN

The total centre of the force of the hole pattern is on the quadrant of the force diagram with 372 kN permissible load (shouldered) or 80 kN permissible load (installed with feather key). Therefore, the process forces on the cam should absolutely be absorbed by a shoulder on the back of the cam base for the given hole pattern and its process parameters:

$$F_{\text{permissible feather key}} < F_P < F_{\text{permissible shoulder}}$$

$$80 \text{ kN} < 173 \text{ kN} < 372 \text{ kN}$$

The individual centres of the force of each punch lie on quadrants of the force diagram in each case with a higher permissible load than the present operating force. A stepped punching caused by the partial shape thus does not cause any unacceptable overloads on the cam unit. In the following, only the forces with the force diagrams installation type "shouldered" are compared:

Punch P₁:
30.1 kN < 91 kN

Punch P₂:
34.3 kN < 164 kN

Punch P₃:
52 kN < 164 kN

Punch P₄:
56.6 kN < 164 kN

ENGINEERING CALCULATION EXAMPLES

Figure 15: Hole pattern with force diagram

The constructional retraction force of the cam is not sufficient to move the slider back into the initial position while the press opens; the return force of the cam is less than the process-induced stripping force:

$$F_R < F_A$$

$$5 \text{ kN} < 17.3 \text{ kN}$$

Die specific actions must be taken in order to ensure that the slider can be returned. In this case, a cam stripper is used.

b) with gas-spring-operated cam stripper

The cam from point a) is equipped with a gas-spring-operated cam stripper to increase the retraction force. It has to be operated by two or three compact gas springs of the POWERLINE series. According to the design, approx. 12 kN retraction force is missing for a smooth process. Springs of the POWERLINE series with a cylinder diameter of 38 mm have an initial force of 5 kN. For the present case, three springs are thus required for the actuation of the cam pad. The springs are mounted using a square mounting flange. The additional installation space required for this is to be taken into account when selecting the cam unit. As a result of the flange dimensions, the width of the slider working surface must be at least 147 mm. Accordingly, the next largest cam unit width is selected with 150 mm. With approx. 8 kN, this cam unit has a greater retraction capacity than the originally selected cam unit with a width of 110 mm. With this cam unit and the selected gas springs, two pieces are sufficient to actuate the cam stripper. In order to be able to accommodate the guide, retaining and safety elements on the cam unit work surface, to obtain a good distribution of the force introduction, and to realise a compact overall space, the springs are arranged diagonally on the working surface (compare illustration).

ENGINEERING

CALCULATION EXAMPLES

Figure 16: Hole pattern with stripper plate

Determination of the centre of the force of the stripper plate.

Shifted by 50 mm in the y-direction for the calculation, the original reference system:

$$x_{CA} = (x_1 \times F_{S1} + x_2 \times F_{S2}) / (F_{S1} + F_{S2})$$

$$x_{CA} = (20 \text{ mm} \times 5 \text{ kN} + 115 \text{ mm} \times 5 \text{ kN}) / (5 \text{ kN} + 5 \text{ kN})$$

$$x_{CA} = 67.5 \text{ mm}$$

$$y_{CA} = (y_1 \times F_{S1} + y_2 \times F_{S2}) / (F_{S1} + F_{S2})$$

$$y_{CA} = (35 \text{ mm} \times 5 \text{ kN} + 140 \text{ mm} \times 5 \text{ kN}) / (5 \text{ kN} + 5 \text{ kN})$$

$$y_{CA} = 87.5 \text{ mm}$$

Determination of the total centre of the force hole pattern + stripper plate

$$x_{Ctotal} = (x_{CA} \times \sum F_S + x_{CB} \times F_B) / (\sum F_S + F_B)$$

$$x_{Ctotal} = (67.5 \text{ mm} \times 10 \text{ kN} + 72.4 \text{ mm} \times 173 \text{ kN}) / (10 \text{ kN} + 173 \text{ kN})$$

$$x_{Ctotal} = 72.1 \text{ mm}$$

$$y_{Ctotal} = (y_{CA} \times \sum F_S + y_{CB} \times F_B) / (\sum F_S + F_B)$$

$$y_{Ctotal} = (87.5 \text{ mm} \times 10 \text{ kN} + 89.1 \text{ mm} \times 173 \text{ kN}) / (10 \text{ kN} + 173 \text{ kN})$$

$$y_{Ctotal} = 89.0 \text{ mm}$$

The additional cam stripper does not cause any unacceptable operating states. Both the force of each punch, the total force of all punches with their centre of the force, the force of the cam stripper with its centre of the force as well as the total force of all the forces acting with the total centre of the force lie within the permissible forces of the respective quadrant of the cam diagram. The cam must be installed shouldered in the die.

ENGINEERING CALCULATION EXAMPLES

$$\Sigma F_S < F_{\text{permissible feather key}} < F_{\text{permissible shoulder}}$$

$$10 \text{ kN} < 110 \text{ kN} < 439 \text{ kN}$$

$$F_{\text{permissible feather key}} < F_{\text{total}} < F_{\text{permissible shoulder}}$$

$$110 \text{ kN} < 183 \text{ kN} < 439 \text{ kN}$$

Figure 17: Hole pattern with stripper plate and force diagram

The sum of the retraction force of the cam and stripper is sufficient to move the cam back into the initial position while the press opens:

$$F_R > F_A$$

$$18 \text{ kN} > 17.3 \text{ kN}$$

ENGINEERING

LOAD-OPTIMISING MEASURES

Constructive actions can reduce or compensate operating and secondary loads (e.g. transverse forces). These actions may have effects on the quality of the press part or the manufacturing process. Therefore they have to be coordinated with the operator of the die.

a) Modified trim steel geometry

In the case of a simultaneous trim steel engagement over the entire cutting length, the cutting work is performed over the path of the sheet thickness. The cutting work is calculated from:

$$W_T = F_T \times t$$

If the trim steel geometry is designed in the form of a shear, a roof or a wave, the working path is extended analogous to the selected trim steel shape. The performed cutting work W_T remains unchanged in its size, therefore the necessary cutting force F_T becomes lower.

Figure 18: Trim steel with parallel grinding

Figure 19: Trim steel with top grinding

Figure 20: Trim steel with scissors grinding

Figure 21: Trim steel with wave grinding

The cutting force can be reduced up to 50% by means of a cutting force reducing design. Due to the geometrically altered design of the trim steels the centre of the force may also vary during the cutting process. A quantitative statement about the centre of the force progression is difficult to determine with trim steels shaped in this way. Due to cam load it's recommended to design the force-optimised trim steels symmetric.

For aluminium press parts, these cutting force reducing actions are not recommended. They can cause uncontrollable, inadmissible process fluctuations here.

ENGINEERING

LOAD-OPTIMISING MEASURES

b) Absorption of transverse forces

Transverse forces cause additional loads on the cam unit components. They add up vectorially to the operating force in the cam direction and thus have a significant influence on the cam unit lifetime. Therefore transverse forces must be compensated by constructive measures in the die in order to prevent system overload. The absorption of the transverse force is preferably performed parallel to the working engagement at the same height.

Figure 22: Absorption of transverse force

A simple description of the relationship between the transverse force and the lifetime is not possible since the permissible transverse force depends on the direction of action and the magnitude of the operating force.

C) Dimensioning of the protrusion

Large tool protrusions over the work surface have an influence on the working result, the system load and the lifetime of the cam unit due to geometric and static effects:

- high weight load on cam unit system due to large tool fittings on the work surface
- Multiplication of the effect by transverse forces due to lever mechanisms
- noticeably faster influence on the work result by lever effect through possible changes in the clearance
- changed damping behaviour

In general, you should therefore endeavour to achieve the smallest possible protrusion in the working area. Standard punching lengths (including retainer plate) + approx. 50 mm can be assumed as a guide.

Overhangs in front of the working surface, which go beyond this guideline, are also possible, but must be checked and evaluated in the course of the die design. FIBRO is pleased to advise and support you.

ENGINEERING

LOAD-OPTIMISING MEASURES

d) Application of compensatory forces

In the case of eccentric operating forces, the total force distribution can be positively influenced by introducing compensating forces. Appropriately dimensioned springs are arranged on the work surface for this purpose, which act against the lower die or against the mounted main pad. Through the use of compensating forces, the total force as well as the total centre of the force change. Accordingly, compensating elements must be taken into account during the course of the cam unit design.

Compensation elements behave analogously to slider strippers. Their force continues to be applied after the end of the working process, for example, after cutting through the sheet metal. The centre of the force of the compensating forces must therefore also be compared with the permissible cam forces in order to make a sound statement about the applied cam force possible (solution path, see chapter "Cam stripper").

Example:

The following values are known for one application case:

Process parameters	cam unit:	2016.24.150.015.1000.0
	Working width:	150 mm
	Angle:	15°
	Cutting length l_1 :	42.7 mm
	Cutting length l_2 :	54.5 mm
	Punch contours + possible arrangement,	see figure
	Sheet metal thickness:	1,2 mm
	Tensile strength:	1,000 N/mm ²

Figure 23: Eccentric hole pattern

ENGINEERING

LOAD-OPTIMISING MEASURES

The forces and centres of the force are as follows:

$$\begin{aligned}
 F_{P_1} &= 41.0 \text{ kN} / x_{C_1} = 12.8 \text{ mm} / y_{C_1} = 62.2 \text{ mm} \\
 F_{P_2} &= 52.2 \text{ kN} / x_{C_2} = 19.2 \text{ mm} / y_{C_2} = 146.6 \text{ mm} \\
 F_{P_{\text{total}}} &= 93.2 \text{ kN} / x_{C_{\text{total}}} = 16.4 \text{ mm} / y_{C_{\text{total}}} = 109.5 \text{ mm}
 \end{aligned}$$

The forces of the cam unit are absorbed by means of a solid cast shoulder on the back of the cam base. Accordingly, the proof of lifetime results after comparison of the forces with the cam load diagram:

$$F_{P_1} < F_{\text{zul}} \quad 41 \text{ kN} < 98 \text{ kN} \quad \rightarrow \text{Loading by punch } P_1 \text{ permissible}$$

$$F_{P_2} > F_{\text{zul}} \quad 52.2 \text{ kN} > 46 \text{ kN} \quad \rightarrow \text{Loading by punch } P_2 \text{ not permissible}$$

$$F_{P_{\text{total}}} > F_{\text{zul}} \quad 93.2 \text{ kN} > 70 \text{ kN} \quad \rightarrow \text{Loading by load sum not permissible}$$

Corresponding to the calculation results, constructive countermeasures must be provided in order to avoid overloading and thus a reduced lifetime of the cam unit. The centre of the force of the punch P2 as well as the total centre of the force must be moved further towards the middle of the cam unit. For this purpose, a compensating spring is to be provided on the working surface of the cam which acts against the main pad of the die:

Selected spring: FIBRO 2487.12.02400.016 (POWERLINE)
 Spring nominal force: 24 kN
 Mounting position x/y: 105 mm / 62.2 mm

By means of this additional spring, the total centre of the force point of the punch P2 and of the spring is shifted to the following coordinates:

$$F_{\text{Compensation}} = 72,6 \text{ kN} / x_{\text{Compensation}} = 46,2 \text{ mm} / y_{\text{Compensation}} = 120 \text{ mm}$$

Figure 24: Eccentric hole pattern with compensation spring

ENGINEERING

LOAD-OPTIMISING MEASURES

With this arrangement, the proof of lifetime no longer produces inadmissible operating conditions:

$$F_{\text{Compensation}} < F_{\text{permissible}}$$

76.2 kN < 147 kN -> Loading by punch P₂ permissible

$$F_{S1} < F_{\text{permissible}}$$

24 kN < 206 kN -> The loading of the compensation spring after the end of the cutting process is permissible.

The solution must be coordinated with the die operator.

ENGINEERING

PROTRUSION BOX

Lateral protrusions beyond the cam unit work surface should generally be avoided - a wider cam unit is the better choice in these application cases. If a lateral protrusion can not be avoided for certain reasons, the following aspects must be ensured to guarantee the desired lifetime:

1. The total working force must not exceed the maximum permissible working force of the cam unit.
2. Asymmetrically arranged elements on the cam unit cause a shift of the centre of the force. The position of the centre of the force must be taken into account and adjusted with the permissible values according to the force diagram.
3. In the case of multiple hole operations on free-form surfaces, it is generally assumed that the hole punches enter the sheet at different times. Punches arranged eccentrically or in the protrusion of the cam work surface require a particularly precise design.

The tool length on cam units also has a significant influence on the system load and the working result of the cam unit. Long protrusions should be avoided whenever possible due to a weaker bending stiffness of the tools and a large lever effect.

EMERGENCY SITUATION / CONTACTS

AERIAL FCC 2016.24.

AERIAL FCC 2016.24.

The FIBRO cam unit FCC 2016.24. features compact dimensions, high forces in the working and return strokes as well as excellent precision, even after a high number of cycles.

All sliding elements are shouldered. The gas spring can be replaced, without having to remove the cam. Due to its design, the FIBRO cam unit series FCC meets the minimum maintenance requirements. The FIBRO cam unit FCC can be designed ex works with customer-specific tool-specific machining, which meets even the highest requirements of modern diemaking processes.

The FIBRO cam units FCC 2016.24. meet the requirements of the BAK product specification as well as the NAAMS.

Design features:

- Double prism guide
- Sliding surfaces hardened steel / bronze with solid lubricant
- Gas spring
- Positive locking connections

FIBRO cam units FCC 2016.24. are available in the widths from 60 to 600 mm and in the angular variants 0° to 75° (gradation 5°).

Order number	Width [mm]	Performance class [kN]*	Page
2016.24.006.□□.2000.00	60	125	57
2016.24.008.□□.1000.00	85	225	67
2016.24.011.□□.1000.00	110	350	77

2016.24.060.□□.2000.00	600	1200	157

* For exact power values, please refer to the force diagrams of the corresponding cam units

Ordering example:

FIBRO cam unit FCC, aerial, width 85 mm = 2016.24.008.□□.1000.00

Cam unit angle $\alpha = 50^\circ$ = 50.

Order number = 2016.24.008. 50. 1000.00

AERIAL FCC 2016.24.006.

Working width: 60 mm
Performance class: 125 kN

* Retraction force values correspond to the spring-generated retraction force at the working point

The forces F_{h2} , F_{v2} as well as F_{h3} , F_{v3} act on the tool environment at maximum working force F_W .

* Retraction force values correspond to the spring-generated retraction force at the working point

The forces F_{h2} , F_{v2} as well as F_{h3} , F_{v3} act on the tool environment at maximum working force F_w .

* Retraction force values correspond to the spring-generated retraction force at the working point

The forces F_{h2} , F_{v2} as well as F_{h3} , F_{v3} act on the tool environment at maximum working force F_W .

* Retraction force values correspond to the spring-generated retraction force at the working point

The forces F_{h2} , F_{v2} as well as F_{h3} , F_{v3} act on the tool environment at maximum working force F_W .

* Retraction force values correspond to the spring-generated retraction force at the working point

The forces F_{h2} , F_{v2} as well as F_{h3} , F_{v3} act on the tool environment at maximum working force F_W .

* Retraction force values correspond to the spring-generated retraction force at the working point

The forces F_{h2} , F_{v2} as well as F_{h3} , F_{v3} act on the tool environment at maximum working force F_W .

* Retraction force values correspond to the spring-generated retraction force at the working point

The forces F_{h2} , F_{v2} as well as F_{h3} , F_{v3} act on the tool environment at maximum working force F_W .

* Retraction force values correspond to the spring-generated retraction force at the working point

The forces F_{h2} , F_{v2} as well as F_{h3} , F_{v3} act on the tool environment at maximum working force F_W .

* Retraction force values correspond to the spring-generated retraction force at the working point

The forces F_{h2} , F_{v2} as well as F_{h3} , F_{v3} act on the tool environment at maximum working force F_W .

* Values rounded

Fastening cam base:

Hexagon socket head cap screws DIN EN ISO 4762
Dowel pins DIN EN ISO 8735

6x M20 / Strength class min. 8.8
2x Ø20

Fastening cam driver :

Hexagon socket head cap screws DIN EN ISO 4762
Dowel pins DIN EN ISO 8735

4x M20 / Strength class min. 8.8
4x Ø20

* Retraction force values correspond to the spring-generated retraction force at the working point

The forces F_{h2} , F_{v2} as well as F_{h3} , F_{v3} act on the tool environment at maximum working force F_W .

* Retraction force values correspond to the spring-generated retraction force at the working point

The forces F_{h2} , F_{v2} as well as F_{h3} , F_{v3} act on the tool environment at maximum working force F_W .

AERIAL FCC
2016.24.006./008./011.
 ASSEMBLY INSTRUCTIONS

Step 1

- ▶ Remove screws (1+2)
- ▶ Remove stop plate (3) of the gas spring
- ▶ Remove spacer (4) and gas spring (5) from the bore

CAUTION

The gas spring may only be removed if the spring is released. After removing the stop plate for the gas spring, observe that there is a risk of crushing between the cam unit driver and the cam unit base due to independent movement of the cam unit driver.

Step 2

- ▶ Slide the cam unit driver into the front position

CAUTION

Risk of crushing between the cam unit driver and the cam unit base by movement of the cam unit driver.

Step 3

- ▶ Insert the lockout sleeve (6)
- ▶ Secure the cam unit driver with the screw (7)

This position corresponds to the closed position (working position) in the tool.

CAUTION

In the classic tool setup process (pressing the cam driver in the die), the positive return left (9) and right (8) must additionally be removed in order to avoid damaging the cam unit, cam driver and die.

AERIAL FCC

2016.24.006./008./011.

ASSEMBLY INSTRUCTIONS

Step 4

Restore the cam unit function after completion of the work (setup, work surface machining).

- ▶ Remove screw (7)
- ▶ Remove the lockout sleeve (6)

Step 5

- ▶ Slide the cam unit driver backwards

CAUTION

Risk of crushing between the cam unit driver and the cam unit base by movement of the cam unit driver.

Step 6

- ▶ Insert gas spring (5) and spacer (4)
- ▶ Insert stop plate (3) for gas spring and secure with screws (2+1)

Screws must be secured against loosening by means of adhesive or suitable lock washers.

AERIAL FCC

2016.24.015./018./022./026./033./040./050.

ASSEMBLY INSTRUCTIONS

Step 1

- ▶ Remove screws (1 + 2)
- ▶ Remove lock washer (3)
- ▶ Remove the stop plate (4) of the gas spring
- ▶ Remove spacer (5) only up to cam unit width 260 mm) and gas spring (6) from the bore

CAUTION

The gas spring may only be removed if the spring is released. After removing the stop plate for the gas spring, observe that there is a risk of crushing between the cam unit driver, stop, and cam unit base due to independent movement of the cam unit driver.

Step 2

- ▶ Slide the cam unit driver into the front position

CAUTION

Risk of crushing between the cam unit driver, stop, and cam unit base by movement of the cam unit driver.

Step 3

- ▶ Insert lockout system (7) and fix with screws (8)
- ▶ Insert the spacer (not shown) between the lockout and the cam unit driver (cam unit width 110 and 150 mm)
- ▶ Fix the cam unit driver with the screws (9)

This position corresponds to the closed position (working position) in the die.

CAUTION

In the classic tool setup process (pressing the cam driver in the die), the positive return right (10) and left (11) must be removed in order to avoid damaging the cam unit, cam driver and die.

AERIAL FCC

2016.24.015./018./022./026./033./040./050.

ASSEMBLY INSTRUCTIONS

Step 4

Restore the cam unit function after completion of the work (setup, work surface machining).

- ▶ Remove screws (9)
- ▶ Remove spacer (not shown) (cam unit width 110 and 150 mm)
- ▶ Loosen the screws (8) and remove the lockout system (7)

Step 5

- ▶ Slide the cam unit driver backwards

CAUTION

Risk of crushing between the cam unit driver, stop, and cam unit base by movement of the cam unit driver.

Step 6

- ▶ Insert the gas spring (6) and the spacer (5) (only up to the slide width 260 mm)
- ▶ Insert the stop plate (4) for the gas spring
- ▶ Insert lock washer (3) (from cam unit width 220m)
- ▶ Fix stop plate and lock washer with screws (2 + 1)

Screws must be secured against loosening by means of adhesive or suitable lock washers.

AERIAL FCC

2016.24.060.

ASSEMBLY INSTRUCTIONS

Step 1

- ▶ Insert the spacer (1) and secure with screws (not shown)
- ▶ Remove screws (2 + 3)
- ▶ Remove lock washers (4)
- ▶ Remove the stop plates (5) of the gas springs
- ▶ Remove the gas springs (6) from the bore

CAUTION

The gas spring may only be removed if the spring is released. After removing the stop plate for the gas spring, observe that there is a risk of crushing between the cam unit driver, stop, and cam unit base due to independent movement of the cam unit driver.

Step 2

- ▶ Slide the cam unit driver into the front position

CAUTION

Risk of crushing between the cam unit driver, stop, and cam unit base by movement of the cam unit driver.

Step 3

- ▶ Fix cam unit driver with lockout screw (7) in the front position

This position corresponds to the closed position (working position) in the tool.

CAUTION

In the classic tool setup process (pressing the cam driver in the tool), the positive return right (8) and left (9) must be removed in order to avoid damaging the cam unit, cam driver and tool.

AERIAL FCC
2016.24.060.
 ASSEMBLY INSTRUCTIONS

Step 4

Restore the cam unit function after completion of the work (setup, work surface machining).

- ▶ Remove lockout screws (7)

Step 5

- ▶ Slide the cam unit driver backwards

CAUTION

Risk of crushing between the cam unit driver, stop, and cam unit base by movement of the cam unit driver.

Step 6

- ▶ Insert gas springs (6) in bores
- ▶ Insert the stop plates (5) for the gas springs
- ▶ Insert lock washers (4)
- ▶ Fix stop plate and lock washer with screws (3 + 2)
- ▶ Remove spacer (1)

Screws must be secured against loosening by means of adhesive or suitable lock washers.

AERIAL FCC

2016.24.

ASSEMBLY IN THE TOOL

Series 2016.24. cam units are designed so that the screws and pins for positioning and securing the cam unit components in the die are accessible in the open position of the cam unit. This accessibility can be restricted or completely prevented by tooling on the cam unit working surface. In such cases, the disassembly / assembly of the fitted cam unit is possible by disassembling the clamp:

Step 1

- ▶ Remove the gas spring before disassembling the cam unit. In the die, the corresponding mechanical clearances must be taken into account backwards.

CAUTION

The gas spring may only be removed if the spring is released. After removing the stop plate for the gas spring, observe that there is a risk of crushing between the cam unit driver and the cam unit base due to independent movement of the cam unit driver.

Step 2

- ▶ Loosen and remove the left and right guide clamps. No removal of positioning pins required! In the die, the corresponding mechanical clearances must be provided at the sides.

AERIAL FCC

2016.24.

ASSEMBLY IN THE TOOL

Step 3

- Lift the (equipped) cam unit upwards.
The cam unit base can remain in the upper die

In the case of installation space problems in the die, an additional mounting plate can also be used as an alternative. The cam unit is positioned and fixed on this mounting plate, the positioning and fastening possibilities to the die lie outside the compact cam unit structure, and are thus easily accessible from above for the necessary fitting aids. Mounting plates are to be provided by the tool shop if necessary, they are not included in the delivery scope of FIBRO cam units.

**AERIAL FCC
2016.25.**

AERIAL FCC 2016.25.

FIBRO FCC cam units series 2016.25. are a continuation of the FCC Series from a width of 700 mm and higher. This series also impresses with its excellent load bearing as well as the highest precision even after a high number of pressing.

All sliding elements of the cam unit correspond to the VDI standard. The sliding elements are shouldered to absorb thrust. The return springs are accessible from the back side of the cam unit, so that they can be dismantled from the die without removing the cam unit.

FIBRO FCC cam units series 2016.25. meet the requirements of the BAK product specifications.

Various ordering options are available for FIBRO FCC cam units series 2016.25.

- The working surface can be optionally equipped with or without shoulder
- Up to an angle of 45°, the cam units are equipped with a pre-acceleration, whereby a choice can be made between roll or plate pre-acceleration.

FIBRO cam units series 2016.25. are machined on the outer surfaces of the back side of the working surface. This makes it possible to machine the working surface of the cam unit with a simple clamping.

FIBRO FCC cam units series 2016.25. are, of course, available ex works, manufactured according to customer requirements. This meets the highest requirements of modern tool and die makers.

Design features:

- Double prismatic guide against cam driver, square positioned guiding elements against cam base.
- Sliding surfaces hardened steel / bronze with solid lubricant
- Gas springs
- Positive locking connections

FIBRO FCC cam units series 2016.25. are available in the widths from 700 to 1050 mm and in the angular variants 0° to 75 ° (gradation 5°).

Order number	Width [mm]	Performance class [kN]*	Page

* Retraction force values correspond to the spring-generated retraction force at the working point point

The forces F_{h2} , F_{v2} as well as F_{h3} , F_{v3} act on the tool environment at maximum working force F_W .

* Values rounded

** Values L, D measured for option with shouldered working surface

*** 9□0 = 900 or 950 mm

Mounting cam base:

Hexagon socket head cap screws DIN EN ISO 4762

8x M20 / Strength class min. 8.8

Dowel pins DIN EN ISO 8735

2x ø16

Mounting cam driver:

Hexagon socket head cap screws DIN EN ISO 4762

2x4 M16 / Strength class min. 8.8

Dowel pins DIN EN ISO 8735

2x2 ø12

up to and including 45° with pre-acceleration

Optionally:

* Roll pre-acceleration (.1000. /.2000.)

** Plate pre-acceleration (.3000. /.4000.)

For inquiries or when ordering spare parts (x), we require the following data:

- Cam unit order no.
- Cam unit serial number
- Item number / Designation / Spare part

* Retraction force values correspond to the spring-generated retraction force at the working point point

The forces F_{h2} , F_{v2} as well as F_{h3} , F_{v3} act on the tool environment at maximum working force F_W .

up to and including 45° with pre-acceleration

Optionally:

* Roll pre-acceleration (.1000. / .2000.)

** Plate pre-acceleration (.3000. / .4000.)

For inquiries or when ordering spare parts (x), we require the following data:

- Cam unit order no.
- Cam unit serial number
- Item number / Designation / Spare part

* Retraction force values correspond to the spring-generated retraction force at the working point point

The forces F_{h2} , F_{v2} as well as F_{h3} , F_{v3} act on the tool environment at maximum working force F_W .

AERIAL ECO LINE 2016.207.

FIBRO ECO LINE cam units series 2016.207. are an economical alternative for cam unit dies with high lifetime requirements. When properly maintained, these cam units allow a high number of cycles with sufficient precision over the entire nominal lifetime.

The gas springs for the cam return stroke can be exchanged without disassembling the cam unit with sufficient free space in the tool.

From a cam unit width of 165 mm, the cam units of the ECO LINE 2016.207. series are equipped with a roll pre-acceleration up to an angle of 25°.

The optional machining of the working surface per your specifications fulfil the requirements for typical toolmaking tolerances.

Design features:

- Prismatic guide against cam driver, flat guide against cam base
- Sliding surfaces hardened steel / bronze with solid lubricant
- Gas springs

FIBRO ECO LINE cam units series 2016.207. are available in the widths from 70 to 400 mm and in the angular variants 0° to 60 ° (gradation 5°).

Order number	Width [mm]	Performance class [kN]*	Page

AERIAL ECO LINE 2016.208.

FIBRO ECO LINE cam units series 2016.208. extend the ECO LINE valve series up to a width of 1000 mm. When properly maintained, these cam units allow a high number of cycles with sufficient precision over the entire nominal lifetime.

The gas springs for the cam unit return stroke can be exchanged without dismounting the cam unit with sufficient free space in the tool.

FIBRO ECO LINE cam unit series 2016.208. are equipped with a roll pre-acceleration up to an angle of 40°.

The optional machining of the working surface per your specifications fulfil the requirements for typical toolmaking tolerances.

Design features:

- Double Prismatic guide against cam driver, flat guide against base.
- Sliding surfaces hardened steel / bronze with solid lubricant
- Gas springs

FIBRO ECO LINE cam units series 2016.208. are available in the widths from 500 to 1000 mm and in the angular variants 0° to 60° (gradation 5°).

* For exact power values, please refer to the specifications of the respective cam unit type

Ordering example:

FIBRO ECO LINE cam unit, aerial, width 900 mm	=	2016.208.□□.090.□□□.21
Cam unit angle $\alpha = 20^\circ$	=	20.
Cam unit stroke according to flow diagram (no option)	=	055.
Order number	=	2016.208. 20. 090. 055. 21

CONTACTS**

CUSTOMER-SPECIFIC SERVICES

SPECIAL MACHINING

Catalogue cam units are equipped with a tool-specific machining for the tool in the mounting surface so that the required components can be fixed on the mounting surface. This machining is performed in the classical process of the toolmaking, often in a certain maturity of the tool itself as well. Process responsibility and risk lie with the executing tool shop.

As a service, FIBRO offers the complete machining of catalogue cam units according to customer specifications. The machining is closely matched to the customer requirements of their tooling process. In addition to conventional qualities, which serve the requirements of classical tooling processes, FIBRO also offers a high-precision finishing of cam units, which are equipped on cam units to be ready for operation (efp*). efp* equipped cam units allow the cam unit to be mounted in the tool with a subsequent initial test press stroke in the tool without further adjustment measures of the cam unit. As a result of processing at FIBRO as extended workbench, we assume the responsibility for the entire cam unit manufacturing process.

Figure 31: Special machining of cam units according to customer data

The tool-specific machining of cam units by FIBRO allows you to further rectify your processes in toolmaking. In addition to relieving logistical capacities, the machining, testing and cleaning of the cam units in your facility is also dispensed with. You keep limited capacities in your mechanical manufacturing and assembly free for other tasks, thus reducing the processing time of the tools and ultimately saving costs.

CUSTOMER-SPECIFIC SERVICES

SPECIAL MACHINING

If you want a tool-specific machining of the cam unit working surface, you can clarify your process-specific requirements, ideally at an early stage before the first order. The cam unit working surface is machined according to the data you provide. Our process is set up for the processing of 3D data in a variety of formats. We prefer to accept data in the format CATIA V5, but we can also process other native and data exchange formats such as step. In order to transfer important information for production, the data must be processed according to a clearly agreed methodology. As a well-established standard, the colour coding of the machined objects has been established according to the colour coding in accordance with the basic guideline for equipment constructions of the German automotive industry (see register APPENDIX "CAD colour coding ..."). Naturally, you can also take your own factory standards into account. The selected standard will be clearly agreed upon with us and clarified in advance.

In the course of an order, we will require the working stock number (tool number) as well as the item numbers of the cam units with special machining. For the respective cam units, the tool-specific machining of the working surface must be noted on the order as an additional text in the order (e.g. "Machining according to CAD data"). The order must be received in time so that the desired delivery date can be met. The regular delivery time for cam units with a specific machining of the mounting surface is 5 to 8 weeks. The actual delivery date depends on the availability of the approved production data. These should be received by us 15 working days before the desired delivery date in the agreed quality. A delayed receipt of the data may lead to a delay in delivery.

Please note that modified requirements to the machining can no longer be ensured after approved production data has already been provided, and this can result in the accepted delivery dates being postponed.

We will be glad to advise you on further questions and we will send you an appropriate offer if you wish.

*efp = equipped for press

CUSTOMER-SPECIFIC SERVICES

CUSTOMER-SPECIFIC CAM UNITS

In many toolmaking areas, purchased cam units are established as a cost-efficient option. Standard solutions can be used for a wide range of applications thanks to a diversified range of cam unit series.

Complex component geometries, overlaps with mechanisation devices or modified geometrical requirements on cam units do not permit the use of standard cam units in various cases. Tool-specifically configured cam units from FIBRO represent an alternative to the self-constructed and self-made cam units used here. This allows application-specific requirements to be combined with the advantages of standard purchase cam units.

Take advantage of our expertise

FIBRO develops tool-specific cam units according to the same technical standards as catalogue cam units. By inquiring at an early stage, we can closely accompany you in the development of dies, and you also have the possibility to design an optimal solution for your application. Our tool-specific cam units means there is no longer any additional logistical effort required in your procurement processes as well as in the parts supply in the workshop. The installation of the tool-specific configured cam unit corresponds to the process sequences of catalogue cam units, assembly and tuning measures within a self-made cam unit are no longer required. The analytical design of these cam units is the basic requirement for a smooth application over the intended life cycle of the cam unit. However, should undesirable wear occur during the tool lifetime, a rapid spare part supply is ensured by the use of a maximum number of standard parts in the cam unit. Through the entire tool development and assembly process, as well as the entire lifetime of the cam unit, FIBRO is thus your competent contact person for all your cam unit questions.

Features customised cam units

Tool-specific configured cam units from FIBRO generally have the same properties and qualities as our catalogue cam units. In general, we can realize working widths up to 1100 mm for you. The conversion possibilities of working widths greater than 1100 mm must be clarified in advance.

What is the process?

Tool-specific cam units are always used when a standard cam unit cannot meet the requirements of the tool. These can be very simple changes, such as a widened working surface, but also very complex scope of changes, such as complete offset cam unit components, multiple working surfaces, modified stiffnesses, etc.

The descriptions as exact as possible of your requirements for the cam unit are the basis for an target-oriented engineering of your tool-specific cam unit. In addition to the desired design principle (on which series your customer-specific cam unit will be based), we will also require a detailed description of the extent of change. Alternatively, you have the possibility to describe your problem to us in the tool and to provide us with design data from your tool (for example, part position, method plan, maximum possible space for the cam unit) as well as the tool environment (e.g. restrictions on mechanisation devices). In this case, FIBRO can handle the entire engineering of the customer-specific cam unit for you.

Of course, you also have the possibility to send us modified CAD data from our catalogue cam units, from which we can then extract the properties of your tool-specific cam unit. The plausibility and feasibility test as well as the manufacturing technology preparation with resultant possible technical modifications are made in our facility due to reasons of the warranty.

CUSTOMER-SPECIFIC SERVICES

CUSTOMER-SPECIFIC CAM UNITS

Normally, you will receive a CAD design draft of the tool-specific cam unit within 3 working days of your request. In the data format CATIA V5, or alternatively in the neutral exchange format STEP, as well as the article number associated with the cam unit. Via these, it is possible for us to clearly assign further arrangements during course of the project, and the cam unit can be procured from us in this way. In parallel to the design, our sales department will work out an offer for you for the tool-specific cam unit.

The manufacturing-technical detailing as well as the production of the tool-specific cam unit only occurs after you give a production go-ahead. After this production go-ahead, bigger changes, for example a change in the cam unit angle are still only conditionally possible according to the progress of the production, and at this point absolutely require an agreement with us. Changes after the production go-ahead may result in additional costs and delays in delivery.

Due to manufacturing reasons, you should give the production go-ahead of the tool-specific cam unit 8 weeks before your desired delivery time. A delayed production go-ahead can lead to a delay in delivery; shorter delivery periods must be agreed with us at an early stage.

If you have any additional questions, our technology and sales departments will be happy to assist you. Contact persons, see the “EMERGENCY SITUATION / CONTACTS” tab.

OVERVIEW

Table of contents, “Appendix” chapter

Overview	307
Lubrication instructions	308
CAD colour coding for machining according to OEM standard	309
Sheet metal materials in vehicle construction	310
Dictionary, English – German	314

APPENDIX

LUBRICATION INSTRUCTIONS

Always prevent the slider and driver surface from running dry, even during the breaking-in of the tools.
An initial lubrication is necessary.

Note: VDI 3378, Observe lubrication of large stamping dies

Recommended: Lithium saponified greases without MoS₂ and graphite additives, e.g.:

DEA:	PARAGON EP1
ESSO:	EXXON multi-purpose grease
MOBIL:	LicAl ÖL 8561
AVIA:	Multi-purpose grease
Fuchs:	Renolin ZAF 46 MB Öl

Information provided without guarantee

APPENDIX

DICTIONARY, ENGLISH – GERMAN

A

accuracy of measurement	Maßgenauigkeit
aerial cam	oben hängender Schieber
alloyed	legiert
attachment lug, clamp	Klammer

B

back-up	Schulter
back-up thrusted	Schulterung
beam / transport beam / side bar	Greiferbalken
bend (to ...)	biegen
blank	Platine
blank die	Platinenschneidwerkzeug
blank holder	Blechhalter
blank thickness	Blechdicke
blanking pressure	Presskraft
blanking pressure / trim force	Schneidkraft
border hardening	randhärten
brass	Messing
bronze with non-liquid lubricant	Bronze mit Festschmierstoff
buck	Aufsatz
burr	Schnittgrat
bush	Buchse
button	Schneidbuchse

C

cam base	Schieberbett
cam base angle	Schieberbettwinkel
cam diagram	Schieber-(ablauf-)diagramm
cam driver	Treiber
cam lock out	Schieberverriegelung
cam slide pad	Schieberniederhalter
cam slide return	Schieberrückholung
cam slide stop / cam buffer	Schieberanschlag
cam slide unit / wedge drive	Keilschieber
cam slider / slide	Schieberteile
cam stroke	Schieberhub
cam stroke plate	Überlaufkeil
cam width	Schieberbreite
cam, wedge drive	Schieber

APPENDIX

DICTIONARY, ENGLISH – GERMAN

carburize (to ...)	einsatzhärten
cast	Guss
center of force	Kraftschwerpunkt
center of gravity	Schwerpunkt
change index	Änderungsindex
clamping gripper	Klemmgreifer
clamping surface, lower	Aufspannfläche unten
clamping surface, upper	Aufspannfläche oben
clearance	Führungsspiel
clinch (to ...)	bördeln
coat (to ...)	beschichten
coil spring	Spiralfeder
common level	gemeinsame Ebene
core	Kern
crossbar	Saugerbalken
crossbar transfer press	Saugerbalkentransferpresse
cutting clearance	Schneidspalt

D

damper / damping element / shock absorber	Dämpfer
diagonal measurement	Diagonalmaß
die	Matrize
die acceptance	Werkzeugabnahme
die closed	Werkzeug geschlossen
die diagram	Werkzeugablaufdiagramm
die mount cam	unten laufender Schieber
die, tool	Werkzeug
dowel	Stift
dowel	Zylinderstift
dowel hole	Stiftloch
draw (to ...)	ziehen
draw die	Ziehwerkzeug
drill (to ...)	bohren
drill (to ...)	drehen
driver angle	Treiberwinkel

E

execution	Ausführung
-----------	------------

APPENDIX

DICTIONARY, ENGLISH – GERMAN

F

feather key	Passfeder
filler cam	Füllschieber
fit (to ...)	passen
flange up	hochstellen
flash, burr	Grat
floater	Luftboden
flowchart	Ablaufdiagramm
force	Kraft
force diagram	Lastdiagramm
form buck	Formaufsatz
form die	Formwerkzeug
full assembled	vollbestückt

G

gas spring	Gasdruckfeder
general information	Beschreibung
grey cast iron	Grauguss
grind (to ...)	schleifen
gripper	Greifer
guide bearing	Führungslager
guide block	Führungsaufnahme
guide bush	Führungsbuchse
guide pin	Führungssäule
guide plate / wear plate	Führungsplatte
guide roller	Führungsrolle
guide strip	Führungsleiste
guiding element / sliding element	Führungselement

H

harden (to ...)	härten
hardened	gehärtet
high alloyed	hochlegiert
high wear	hochbeansprucht
horizontal force	Horizontalkraft n

I

identification plate	Kennzeichenschild
impact plate	Anschlagplatte
included angle	eingeschlossener Winkel

APPENDIX

DICTIONARY, ENGLISH – GERMAN

included angle	Schieberteilwinkel
induction harden	induktionshärten
interference curve	Freigängigkeitskurve
item number	Position

K

key, wedge	Keil
keyway	Keilsitz

L

label	Schild
length	Länge
length of trim line	Beschnittlänge
light duty	leichte Ausführung
lock out	Lock out
lock out	Verriegelung
lock out plate	Lock out Platte
lock out tube	Lock out Hülse
lock out tube	Verriegelungshülse
lower die	Gussunterteil
lower die	Unterteil
lower die	Werkzeugunterteil
lubricant insert	Festschmierstoff
lubrication	Schmierung

M

machine (to ...)	bearbeiten
machining	Bearbeitung
maintenance	Instandhaltung
mill (to ...)	fräsen
mount (to ...)	montieren
mounting surface	Montagefläche
mounting surface, bottom	Aufspannplatte unten
mounting surface, top	Aufspannplatte oben

N

nodular graphite iron	Sphäroguss
normalize	glühen

APPENDIX

DICTIONARY, ENGLISH – GERMAN

O

order code / order no. Bestell-Nummer

P

pad	Niederhalter
pad travel	Niederhalterweg
pattern	Gießmodell
pattern release	Modellfreigabe
pierce (to ...)	lochen
pierce die	Lochwerkzeug
piercing bush, button	Lochbuchse
pillar, guide pin	Säule
pin, bolt	Bolzen
positiv locking	Formschluss
positive return	Zwangsrückholer, Zwangsrückzug
pre-acceleration	Vorbeschleunigung
pre-acceleration angle	Vorbeschleunigungswinkel
pre-acceleration stroke	Vorbeschleunigungshub
press fit	Presspassung
press stroke	Pressenhub
press tonnage	Pressen-Nennkraft
prism	Prisma
progressive die	Folge-(verbund-) werkzeug
protrusion	Überhang
punch	Lochstempel
punch	Schneidstempel
punch	Stempel
punch	Ziehstempel
punch retainer	Stempelhalteplatte
punch stripper	Stempelabstreifer
punching force	Kraft für Lochen
punching tool / trim die	Schneidwerkzeug

R

reference point	Bezugspunkt
release	Zeichnungsfreigabe
release (to ...)	freigeben
restrike (to ...)	nachschlagen
restrike steel	Nachschlagbacken
retraction force	Rückzugskraft

APPENDIX

DICTIONARY, ENGLISH – GERMAN

return	Rückstellung
return force	Rückstellkraft
rework, modify (to ...)	nacharbeiten
rubber spring	Gummifeder
S	
scrap	Schrott
scrap chute	Abfallrutsche
shaft screw	Passschraube
sharp edges removed	Kante gebrochen
shear strength	Scherfestigkeit
shock absorber / damping element	Stoßdämpfer
shut height	Bauhöhe
shut height	Einbauhöhe
sidebar transfer press	Greifertransferpresse
slide	Gleitfläche
slide direction	Gleitrichtung
slide fit	Gleitsitz
slide plane	Gleitebenen
sliding pad / wear plate	Gleitplatte
slug	Lochbutzen
spare part	Ersatzteil
spare part list	Ersatzteilliste
spark, wire cut (to ...)	erodieren
spot (to ...)	tuschieren
spotting press	Tuschierpresse
spring	Feder
spring force	Federkraft
spring stroke	Federhub
steel hardened	Stahl gehärtet
stick	klemmen
stock list	Stückliste
strip layout	Streifenbild
stripper	Abstreifer
stripper force	Abstreifkraft
stroke	Hub
suction cup	Sauger

APPENDIX

DICTIONARY, ENGLISH – GERMAN

T

take thrust out (to ...)	Schub abfangen
tapped hole	Gewindebohrung
tensile strenght	Zugfestigkeit
term	Bezeichnung
thrust	Schub
tight fit	Presssitz
time	Zeit
tool steel	Werkzeugstahl
torque	Drehmoment
towing hole	Transportgewinde
transfer press	Stufenpresse
trim (to ...)	beschneiden
trim buck	Schneidaufsatz
trim die	Beschneidewerkzeug
trim line	Beschneidekante
trim steel	Messer
trim steel	Schneidmesser
type	Bauart

U

upper die	Gussoberteil
upper die	Oberteil
upper die	Werkzeugoberteil
urethan spring	Kunststofffeder
urethan stripper	Kunststoffabstreifer

V

vertical force	Vertikalkraft
v-guide	Prismaführung

W

wear	Verschleiß
weld (to ...)	schweißen
working angle / cam	Schieber-(arbeits-)winkel
working area / mounting surface	Schieberarbeitsfläche
working force	Arbeitskraft
working force	Betriebslast
working stroke / cam stroke	Schieber-(arbeits-)hub

CUSTOMER-SPECIFIC SERVICES

APPENDIX

**EMERGENCY SITUATION /
CONTACTS**

EMERGENCY SITUATION / CONTACTS

FIBRO cam units are marked with a unique, unmistakable serial number.

Since October 2017, these serial numbers, together with all other important names, are grouped together on a type plate (see fig.).

Until September 2017 the serial numbers were engraved directly on the cam units.

The type plate is located on the side of your cam unit.

Legend:

Art. No:	article number	(order number)
Std:	Standard	(standard)
W/A:	width/angle	(width/angle)
Serial:	serial number	(serial number)
Pos:	position	(Position)
GS:	gas spring	(gas spring)
GS:	gas spring	(gas spring)

In order to help you as quickly as possible, we require both the article number and the unique serial number when ordering individual spare parts as well as when replacing a complete cam unit in case of a crash.

In these cases, please always include the serial number for a quick handling of your needs.

If an acute emergency occurs, for example, in the form of a tool crash, we are there for you. In the event of a crash, you can reach us as follows:

via phone: +49 (6266) 73-112

via email: cam.crash@fibro.de

EMERGENCY SITUATION / CONTACTS

FIBRO offers you a comprehensive service in the field of cam units to help you with advice and action if necessary.

- Spare parts deliveries ex stock
- The fastest possible delivery of replacement cam units in the event of a crash
- Construction support

If you have any questions concerning our cam unit program, please contact:

Markus Meyer
Head of Cam Unit Applications
cam.engineering@fibro.de
+49 (6266) 73-210

Georg Schreck
Product Manager Cam Unit Applications
cam.engineering@fibro.de
+49 (6266) 73-210

Markus Steinhilber
Key Account Manager Cam Unit Applications
m.steinhilber@fibro.de
+49 (151) 64975857

EMERGENCY SITUATION / CONTACTS

For offers and price information, please contact your regional supply centre:

Germany	Postal code region 1... – 6...	ac1.normalien@fibro.de
	Postal code region 7... – 0...	ac2.normalien@fibro.de
International	Eastern Europe, Africa, Asia	ac3.normalien@fibro.de
	Western Europe, North and South America	ac4.normalien@fibro.de

For orders, date information and general service questions, please contact your local sales centre:

Germany	Postal code region 1... – 6...	vc1.normalien@fibro.de
	Postal code region 7... – 0...	vc2.normalien@fibro.de
International	Eastern Europe, Africa, Asia	vc3.normalien@fibro.de
	Western Europe, North and South America, Australia	vc4.normalien@fibro.de

... or contact your on-site partner, please see pages 4-7.
